Dear Sir,

I would like to congratulate Muneshwar JN, Mirza Shiraz Baig, Zingade US, Khan ST for highlighting a very important issue regarding the teaching methods for health care professionals.1 Study has proved the Chinese proverb: “If I hear, I forget; if I see, I remember; if I do, I know”. Along with this I want to focus little on “podcast” as new teaching method.

At present, education trend have changed from pedagogy to andragogy i.e. from a teacher-centered learning to a student-centered learning. These methods of education trends have identified many different learning styles as well. So, now it has become necessary for educators to train themselves to upcoming teaching methods. 2

Many new teaching methods are evolving in the current electronic world. In which Podcasts as a supplement to live lectures is one of the teaching method, which have been adopted by many universities. Podcasting is user friendly, where information is recorded, then uploaded to a website or published through programs like iTunes and made accessible to students. The file can then be played on a computer or digital player.3,4

Recently many studies have been conducted using podcast as a new aid and its effectiveness. Studies have shown that audio podcasts as an effective aid for review before exams, enhancing student performance; acceptability and perceived utility of podcasts was good among students. Introduction of podcasts in the beginning will offer the students a lot of flexibility in learning, with regard to place and time.5

Podcasts as a supplement to live lectures as teaching method has open up for future research to assess their utility on a long-term basis so as to pave the way for introducing podcasts as one of the teaching method.
